SIEMENS CORP. IPD-W

IN THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application.

- (Currently Amended) A method for providing a conferencing session, comprising:
 receiving inputs from a number of participants in a <u>the</u> conferencing session;
 determining a number of prominent inputs from the received inputs; end
 combining the determined prominent inputs into a first output stream suitable for being sent to at least one participant of the number of participants in the conferencing session; and
 - combining determined prominent inputs into a second output stream for an originating participant of a prominent input of the determined number of prominent inputs, the second output stream not including the originating participant's input.
- (Original) The method as described in claim 1, wherein inputs are determined as
 prominent based upon a characteristic including at least one of loudness, signal strength,
 clarity and prominence history.
- 3. (Canceled)
- 4. (Currently Amended) The method as described in claim 31, further comprising sending the first output stream to participants which did not originate a prominent output and sending the second output stream to the participant originating the prominent input not included in the second output stream.
- 5. (Currently Amended) The method as described in claim 31, wherein the second output stream includes a next most prominent received input.
- 6. (Original) The method as described in claim 5, wherein the next most prominent received input is determined by a characteristic different than the characteristic utilized to determine the number of prominent inputs from the received inputs.

- 7. (Original) The method as described in claim 1, wherein the number of prominent inputs to be determined is pre-selected.
- 8. (Original) The method as described in claim 1, wherein determining the prominent inputs includes determining if an input corresponds to a desired characteristic threshold.
- (Original) The method as described in claim 1, wherein the conferencing session is utilized over a packetized system so that at least one of the received inputs and output stream are configured as packets.
- 10. (Currently Amended) A method for providing a conferencing session, comprising: receiving inputs from a number of participants in a the conferencing session; determining a number of prominent inputs from the received inputs, the inputs being determined as prominent based upon a characteristic including at least one of loudness, signal strength, clarity, and prominence history; and combining received inputs into an output stream for an originating participant of an input of the received inputs, the output stream not including the originating participant's input and including a next most prominent received input
- 11. (Canceled)
- 12. (Canceled)
- 13. (Canceled)
- 14. (Currently Amended) The method as described in claim 1310, wherein the next most prominent received input is determined by a characteristic different than the characteristic utilized to determine the number of prominent inputs from the received inputs.

- 15. (Currently Amended) The method as described in claim 1110, wherein the number of prominent inputs to be determined is pre-selected.
- 16. (Currently Amended) The method as described in claim 1110, wherein determining the prominent inputs includes determining if an input corresponds to a desired characteristic threshold.
- 17. (Original) The method as described in claim 10, wherein the conferencing session is utilized over a packetized system so that at least one of the received inputs and outputs are configured as packetized streams.
- 18. (Currently Amended) A conferencing system suitable for providing a conferencing session to a plurality of participants, comprising:
 - a multipoint conferencing unit communicatively coupled over a packetized connection to a plurality of input/output devices so as to enable the participants of a the conferencing session to interact, wherein the multipoint conferencing unit is configured to

receive inputs from the participants in the conferencing session;
determine a number of prominent inputs from the received inputs; and
combine the determined prominent inputs into a first output stream
suitable for being sent to at least one participant of the
conferencing session; and

- combine the determined prominent inputs into a second output stream for an originating participant of a prominent input of the determined number of prominent inputs, the second output stream not including the originating participant's input.
- 19. (Original) The conferencing system as described in claim 18, wherein inputs are determined as prominent based upon a characteristic including at least one of loudness, signal strength, clarity and prominence history.

20. (Canceled)

- 21. (Currently Amended) The conferencing system as described in claim 2018, wherein the first output stream is sent to participants which did not originate a prominent output and the second output stream is sent to the participant originating the prominent input not included in the second output stream.
- 22. (Currently Amended) The conferencing system as described in claim 2018, wherein the second output stream includes a next prominent received input.
- 23. (Original) The conferencing system as described in claim 22, wherein the next prominent received input is determined by a characteristic different than the characteristic utilized to determine the number of prominent inputs from the received inputs.
- 24. (Original) The conferencing system as described in claim 18, wherein the number of prominent inputs to be determined is pre-selected.
- 25. (Original) The conferencing system as described in claim 18, wherein determining the prominent inputs includes determining if an input corresponds to a desired characteristic threshold.
